SUBMISSION COMPANION

Finish the handoff with confidence.

Ready now

Formatted React source is separated into data, pages and reusable components. README includes eight student-supplied UI screenshots, setup instructions and attribution. Vercel configuration files are included. A technical report draft and presentation notes are prepared.

Still requires your details or account access

Item	Action
Student details	Jaafar Sabra / 72230515 / Ghadir Khalil / LIU / individual project.
GitHub	Publish the supplied local repository from your own GitHub account.
Approved hosting	Sign in to Vercel, import the GitHub repository and add the final URL.
Mobile evidence	Capture current phone screens and run the listed checks.
Contribution statement	Fill each student's actual tasks; use the lecturer's official form.

Deployment settings

Vercel: import the GitHub repository, choose Vite, build with npm run build and publish dist/. No environment variables are needed.

Final smoke test

Open every page on the final live URL. Search and filter the menu, customize a dish, add multiple extras, change quantity, enlarge a photo, refresh the bag, switch delivery to pickup, place a fictional demo order, and open the map. On a phone, check navigation, scrolling, modal controls and that no content is clipped.

Presentation timing

Suggested 5-6 minutes: opening 30 seconds; design 45 seconds; customer flow 90 seconds; implementation 60 seconds; validation and limits 45 seconds; closing 15 seconds. Adjust to the lecturer's actual time limit.

SPEAKING NOTES

A simple presentation script.

Hello. My project is EMBER, a restaurant ordering website built with React. The slogan is Worth the craving. The goal is to let a customer browse food, customize a dish, add it to a bag, choose pickup or delivery, and follow the order. This is Phase 1, so the ordering and tracking are frontend demonstrations.

Design and pages - 45 seconds

The website has seven pages: Home, Our Story, Experience, Menu, Contact, Checkout and Order Tracking. I used charcoal, warm ivory and burnt orange for a consistent restaurant identity. Large photographs introduce the main pages. The lower sections are simpler so the food and actions stay clear. The header, footer, buttons and typography are shared across pages. CSS media queries adapt the layout and navigation for smaller screens.

Customer flow - 90 seconds

On the menu, a customer can filter by category or search by name and description. Clicking a product or its plus button opens customization, rather than adding it immediately. Different dishes have different choices, such as bread, sauce, heat level or milk. Extras have clear prices. The customer can also add a note and change the quantity. The enlarged image has zoom and drag controls. After adding the dish, a thumbnail flies to the bag and the bag count updates.

In checkout, each line shows its selected options and quantity. Delivery costs three dollars. Pickup removes that fee. The form checks the required information before placing a demo order. Checkout then opens tracking with the saved order summary. The tracker advances through four demonstration stages every twenty seconds. The contact page also has a validated form and a real Beirut city map. The map does not claim an exact restaurant address.

Implementation - 60 seconds

The application uses React components and state. The menu and customization options are stored in separate data files. Each page has its own file, and reusable elements are in a shared components file. The URL hash selects the current page, which works on a static host without special route rewrites. The cart and latest order are saved in localStorage so they remain after a refresh. When checkout completes, the app saves an order snapshot before clearing the bag. Prices are calculated from the base price, selected extras and quantity.

Validation and limits - 45 seconds

I checked the build and browser interactions, including filters, customization pricing, image enlargement, pickup fees, checkout, tracking, contact confirmation and the map. The design also supports reduced-motion preferences. No real payment is taken, and no order or contact message is sent to a server. I will follow the next phase's brief before adding those features.

Closing - 15 seconds

The project demonstrates a complete frontend restaurant journey with responsive design, reusable React components and clear interactions. Thank you. I can now show the ordering flow.

DEMO AND QUESTIONS

Show the journey. Explain the choices.

Live demonstration

1. Home: explain the identity and open Menu.
2. Filter and search, then use a plus button to open customization.
3. Select extras, increase quantity and explain the total.
4. Enlarge the photo, zoom and return.
5. Add to the bag and show the animation.
6. Switch to Pickup to remove the delivery fee.
7. Use fictional test details and show order tracking.
8. Open Contact and the Beirut map.

Likely questions and short answers

Question	Answer
Why React?	Reusable components and state update the interface without a full reload.
What is dynamic?	Filtering, customization, quantities, totals, confirmation and tracking.
Why localStorage?	Browser persistence for Phase 1; it is not a shared database.
How do totals work?	Base price plus choices/extras, multiplied by quantity; delivery adds $3.
How are custom items separated?	The cart key includes the product, selections and note.
Is tracking live?	No. Timestamp-based demonstration stages advance every 20 seconds.
Does Contact send email?	No. It validates input and saves a local demonstration message.
Was AI used?	Yes. Explain the assistance honestly and your own work accurately.

INDIVIDUAL CONTRIBUTION

Complete this honestly.

Use the lecturer's official attached form when available. Every group member submits their own statement. This is a working template, not a claim about who completed the project.

Student name: Jaafar Sabra
Student ID: 72230515
Instructor: Ghadir Khalil
Institution: Lebanese International University (LIU)
Project mode: Individual - no partner
Course: CSCI426 - Advanced Web Programming
Project: EMBER - Restaurant Ordering Frontend

My actual work

Task / component	What I personally did	Evidence: file / commit
_____	_____	_____
_____	_____	_____
_____	_____	_____

Individual project

No group partner. Complete the personal-work section and assistance disclosure accurately. If the instructor requires the official form for solo students, transfer these details to that form.

Assistance and sources

Describe AI assistance, image sources and what you reviewed or changed yourself:
